Assignment 01:Smart Study Notes Generator using Generative AI

Brief Description:

The Smart Study Notes Generator is a Generative AI based application developed using Python and the Gemini API. The system automatically generates structured study notes based on user inputs such as subject, topic, difficulty level, format, and length of notes.

This application demonstrates how Large Language Models (LLMs) can assist students in learning by generating concise and structured notes for academic subjects. Instead of manually searching for information, students can quickly obtain organized explanations and bullet-point notes using AI.

The application uses prompt engineering techniques to send structured instructions to the Gemini model, which then generates meaningful and relevant study material.

Technologies Used:

Python, Gemini API, Google Colab, Prompt Engineering, and Generative AI.
